2

Part: 4 Security protection products

bre

Foreword by the United Arab Emirates (UAE) Acting Commander in Chief, Major General Rashid Thani Al Matrooshi

As the dynamic environment in our Region progresses, we the UAE Civil Defence Authority, has set forth a number of strategic goals for the delivery of public safety. Our strategic goals observe both the national and Ministry of Interior's strategic plan by;

“Providing an effective firefighting and emergency response system delivered by qualified and well trained people using the latest technologies to ensure lives and properties are safeguarded”

As a result, the UAE can be 'benchmarked' with other Countries that are witnessing a decline in fires and incidents when compared to the density of population. As an example, the number of fire incidents has been reduced by 39% in 2011 compared to 2010, with a marked reduction in small and medium fire incidents, together with a high percentage achievement of a 9 minute response time for first attendance at incidents.

“Providing excellent performance and support during disasters and crises”

Confirmation of performance and support are achieved during disasters and crisis situations. Civil Defence Departments conduct a range of joint fire safety and evacuation drills in association with other safety agencies for both the public and private sectors. Evacuation drills carried out in Dubai during 2011 was estimated at 356 drills, which targeted 178,530 persons. Customer satisfaction percentage achieved was 97.2%. The number of drills carried out has increased by 142.4% compared to the target number set out in our annual plan.

“Spreading a fire safety and awareness culture across the community “

In this regard, a National Safety campaign was launched targeting 'domestic safety' with an achieved target of 50% of homes in UAE being visited during a six month period. This was aimed at preventive awareness and removing violations which threaten public safety. During the campaign, 206,490 houses (61.4% of the total dwellings) were visited, again with a marked customer satisfaction percentage of 92%.

Similarly a National Safety campaign was also executed at industrial areas, with teams visiting industrial facilities at different industrial areas across the country. 31,647 facilities were inspected. The teams also managed to correct violation situations in 13,400 facilities and 53,426 people were trained in the basic skills of firefighting and awareness.

“Equipping operations with the best and appropriate equipment and technologies”

The latest state of the art technologies have been introduced for various services such as, 'e-engineering' for online drawing approval and the '24 x 7 smart system' for building electronic monitoring and protection. Currently 61.7% of buildings are connected to the system and 95.7% surveyed for connection.

In addition, the 'UAE Fire and Life Safety Code of Practice' with our Standard Operating Procedures (SOPs) is considered a first in the region. This will contribute to reduced costs and effort. Ultimately this will result in a decrease in accidents and improve command and control mechanisms.

“Achieving Strategic Partnership with Public/Private and Voluntary Organizations”

By ensuring, through careful selection, that products, systems and installers are approved with a listing by Civil Defence, following rigorous third party certification. This ensures that locally we receive the best performance of fire safety products, systems and technologies.

LPCB is widely recognised as an independent reference for all fire and security safety experts. Their testing laboratories and approvals services together with their leading team of highly qualified expert scientists and engineers, guides us all impeccably towards a qualified framework.

Major General Rashid Thani Al Matrooshi

Introduction

BRE Global Ltd, based in the UK near London, is an independent third party organisation offering certification of fire, security and sustainability products and services to an international market. LPCB is the certification brand used for fire and security products and services. The LPCB mark is accepted worldwide. We have representative offices in China, India and Dubai. We are owned by the BRE Trust, a not-for-profit organisation.

LPCB listings can be accessed, free of charge, at www.redbooklive.com or via apps from Apple, Google and Windows.

BRE Global Ltd is also a Notified Certification Body and Notified Test Laboratory for:-

- Construction Products Regulation
- Pressure Equipment Directive
- Marine Equipment Directive
- Transport Pressure Equipment Directive

BRE Global additionally carries out:

- Fire Investigation
- Fire Risk Assessment
- Fire Safety Engineering
- Research
- Training

LPCB Listings

Listings are given in sections which list related groups of products and services such as suppression, security and so on. Each section also summarises the technical basis for the certification of each product or service. The Red Book listings should always be used in conjunction with rules, regulations and design specifications required by the relevant Authority having jurisdiction.

Listings comprise:

Volume 1:

- Fire detection and alarm products, systems, and cables
- Manual fire extinguishing equipment
- Automatic sprinkler, water spray and deluge systems
- Fixed fire fighting products and systems
- Watermist systems
- Related installers

Volume 2: (This Volume)

- **Passive fire protection products**
- **Security protection products**
- **Fire doors and shutters**
- **Smoke and fire ventilation systems**
- **Security Assessments - SABRE**
- **Related installers**
- **Management Systems**
- **Construction products**

Listings are given in the name of the manufacturer or service provider, in alphabetical order. They can be downloaded free of charge from our website at www.redbooklive.com and also via an App that is available free from Apple iStore (for iPhone and iPad), from Google Play, (for Android phones and tablets) and Windows Store (for Windows 8 phones).

Updates

Certification of products and services are updated regularly. To ensure that you are using the most up to date information please refer to <<<<<www.redbooklive.com>>>>> or download the App.

What is Third Party Certification?

A frequent concern of stakeholders is in knowing whether a product will perform in accordance with the stated specifications. These concerns can involve such product attributes as safety, health or environmental impacts, durability, compatibility, suitability for intended purposes or for stated conditions, and other similar considerations. These issues can all be addressed through product certification.

Third party certification is a conformity assessment process, carried out by a body that is independent of both supplier and customer organisations. It provides confirmation that products and services have met and will continue to meet the requirements of specified standards and other normative documents.

LPCB third party product certification schemes are quality assurance schemes and comprise initial type testing and technical evaluation, assessment and surveillance of the manufacturer's quality system and factory production procedures, regular audit testing, labelling and listing.

Similarly, LPCB schemes for suppliers of services (installers) are also quality assurance schemes comprising a technical assessment of an installer's capability, assessment and surveillance of the installer's quality system and production procedures, regular inspection of completed installations and listing.

Benefits of Third Party Certification

For specifiers, regulators, insurers, manufacturers and installers, the benefits of an LPCB approval are:

For specifiers and regulators:

- Risk reduction - specifying LPCB approved products and services demonstrates due-diligence and best endeavour and mitigates against possible accusations of negligence.
- Avoidance of costly mistakes - you can trust LPCB approved products and services to conform each and every time.
- Time - using Red Book Live to search for and assess products and services can save you time.

For manufacturers and installers:

- Increased global sales - LPCB approval is recognised and specified widely throughout the world. In some territories LPCB approval is a mandatory requirement.
- Added value of the product or service - LPCB approved products and services are recognised as providing added value given their ability to conform each and every time.
- Reduced liability - LPCB approved products and services demonstrate due-diligence which can reduce liability for both you and your customers.

What does LPCB Certification offer?

LPCB certification is carried out against Loss Prevention Standards (LPS's). These LPS's include reference to BS, EN or ISO standards as appropriate. LPCB certification are level 5 schemes as detailed in ISO/ IEC 17067 with the added requirement to have a quality system certificated to ISO 9001.

The technical requirements of LPCB schemes are given in the Loss Prevention Standards (LPSs). These documents are drafted by LPCB technical experts in conjunction with appropriate external experts. They are then peer reviewed by representatives from trade bodies, regulators, insurers, specifiers, manufacturers and other suppliers. Finally these documents are approved for use by the BRE Global Governing Body; the Body that oversees all of the certification activities of BRE Global.

Product schemes comprise:

- Initial type testing and evaluation of product.
- Approval and surveillance of the manufacturer's (or supplier's) quality management system to ISO 9001
- Assessment and surveillance of the manufacturer's (or supplier) factory production control system (FPC).
- Periodic audit testing of the product from either the factory or marketplace.
- Labelling or marking as appropriate.
- Listing on Red Book Live

VOLUME 2 LIST OF APPROVED PRODUCTS AND SERVICES

Installer schemes comprise:

- Technical assessment of the installation contractor's capability.
- Approval and surveillance of the contractor's quality management system to ISO 9001 or assessment against the requirements of the relevant Loss Prevention Standard where ISO 9001 is not appropriate.
- Regular surveillance inspections of on-going installations.
- The issue of Certificates of Conformity by the installer to demonstrate compliance for each installation.
- Listing in the Red Book.

The LPCB Mark - the Mark you can trust

After certification of a product or service the manufacturer or service provider may place the LPCB certification mark, as shown below, on the product, packaging and literature etc.

Where LPCB holds accreditation through the United Kingdom Accreditation Service (UKAS), the certified company may include the UKAS symbol (the Crown and Tick) alongside the LPCB mark for certain applications e.g. promotional literature or material and stationery, as shown below.

(Full details of LPCB accreditation can be found on the UKAS website at www.ukas.com)

Where for reasons of space or cost the use of the above full mark is not practical, then the following simplified mark may be applied directly to the product (for some schemes only). The LPCB scheme rules define how and where the marks can be used.

The products listed in Volume 2: Part 5 - Construction Products, are approved under our BRE Global Certification brand - the certification mark for this brand is:-

4 Security protection products	1
SECTION 1.1 Intrusion and hold-up alarm system components	3
SECTION 1.2 Alarm transmission equipment and systems	4
SECTION 1.2.1 Supervised premises transceivers (Security) LPS 1277	5

*SECURITY PROTECTION
PRODUCTS*

PART 4: SECURITY PROTECTION PRODUCTS

INTRODUCTION

The effects of crime on a commercial business can be devastating. Some businesses never recover from the consequential losses; the interruption to business continuity, the theft of capital, stock or intellectual property and even the loss of the entire business premises due to arson. Figures released by the Home Office in 2013 based on the 2012 Commercial Victimization Survey¹ show there were 340 burglaries or attempted burglaries per 1000 commercial premises in urban areas of the UK (206 in rural areas). Forced entry through doors to facilitate the theft of goods and stock being the most commonly reported incidents.

Installing security measures that provide early detection of an intrusion attempt and effective physical security that provides a suitable delay to intrusion greatly increases the likelihood that intruders can be apprehended at the scene. This not only reduces the likelihood of such crimes being successful, it acts as an effective deterrent, greatly reducing the chance of being targeted by intruders in the first instance.

Using security products approved by LPCB to protect people, property and assets is an effective way of mitigating many of the risks associated with crime and increasingly, the threat of terrorism. LPCB works closely with police, government, insurers, end users, security equipment specifiers and manufacturers to develop methods by which the quality of product performance and product reliability can be assessed effectively.

The products listed in this section have been rigorously tested and assessed by LPCB experts to a range of standards. Their on-going conformity is assured through rigorous surveillance programmes involving periodic auditing of production and regular inspection of the products themselves during production.

Details of the standards to which the products are approved are given at the front of each subsection relevant to the product type.

The range of products listed is extensive and includes physical barrier type products, asset marking, computer protection equipment as well as electronic detection and surveillance equipment.

The scope of each product's approval is described in the relevant section and on the certificates issued to the approved manufacturer. It is important to ensure only products covered by the scope detailed on the LPCB certificate are selected. This is because products outside that scope may not provide an equivalent level of security.

¹ Home Office publication - *Crime against businesses: Detailed findings from the 2012 Commercial Victimization Survey. June 2013*

This section lists components of intrusion and hold-up alarm systems where compliance with the applicable part of the EN 50131 series of product standards has been confirmed by LPCB experts and most importantly on going assessment confirms the component continues to comply with the requirements.

Loss Prevention Standards LPS 1602 (movement detectors) and LPS1603 (control and indicating equipment) have been withdrawn and are superseded by European Standards EN 50131-2-2, EN 50131-2-3, EN 50131-2-4 and EN 50131-2-5 for movement detectors and EN 50131-3 and EN 50131-6 for control and indicating equipment and power supply equipment.

PART 4: SECTION 1.2

ALARM TRANSMISSION EQUIPMENT AND SYSTEMS

This section lists alarm transmission equipment suitable for use with intrusion and hold-up alarm systems. Alarm transmission and fault warning routing equipment suitable for use with fire alarm systems is listed in 'Fire Detection and Alarm Systems; Supervised Premises Transceivers (fire)'.

Where alarm transmission equipment is suitable for use with both intrusion and hold-up systems and fire alarm systems, the entry will appear in 'Intruder and Hold-up Alarm System Components' and 'Fire Detection and Alarm Systems; Supervised Premises Transceivers (fire)'.

The following standard is currently used for the certification scheme:

- LPS 1277 Issue 4, *Requirements for LPCB Certification and Red Book Listing of Supervised Premises Transceivers: Intrusion and Hold-up Alarm Systems.*

Where appropriate within LPS 1277, reference has been made to published standards for intrusion and hold-up systems including EN 50131-1 together with the alarm transmission system and product standards EN 50136-1: 2012 and EN 20136-2: 2013.

Particular emphasis is placed on the verification of manufacturers' claims, by measuring alarm transmission times over the transmission path(s) between the equipment under test and the corresponding receiving centre. The response to the reporting of fault conditions is measured in a similar way.

The results of these measurements are expressed in terms of alarm transmission system performance criteria, DP 1-4 and SP 1-6 using the parameters D, M, T and where applicable S and I.

Where:

D = Transmission time classification
M = Transmission time maximum values
T = Fault reporting time classification
S = Substitution Security
I = Information Security

Availability is considered a key parameter under LPCB certification and is therefore included within the requirements of LPS 1277. The resultant performance is expressed using the parameter 'A' for Availability.

The measured parameters are used to determine the performance classification (DP 1-4 and SP 1-6), that when used in conjunction with warning devices provide notification according to the security grade of the intrusion and hold-up alarm system (I&HAS) as defined in EN 50131-1.

Products compliant with LPS 1277 Issue 4 meet 'enhanced' performance classifications which includes an additional 10 minute fault reporting time, timed 'stepped up' fault reporting after the loss of the primary path and the reporting of a catastrophic failure, in event of the simultaneous loss of multiple transmission paths.

To assist specifiers in their selection of the products most appropriate for protecting their risks, the LPCB enhanced performance ratings are included with the product listing entry in the Redbook as an indicator of the level of performance that can be expected from the alarm transmission system.

Compliance with relevant safety standards and applicable mandatory EU directives is a pre-requisite of LPCB certification and listing. Regular product audits factory inspections are carried out by LPCB to ensure high manufacturing standards and continued compliance with the applicable product standard.

Note

Since LPCB certifies products against national and international standards, in some instances the requirements of these standards may conflict with the recommendations of local codes of practice. We recommend that specifiers seek advice from the relevant local authorities and amend their specifications accordingly.

The equipment listed in this section has been assessed against the requirements and test methods of LPS 1277 *Requirements for LPCB Approval and listing of Alarm Transmission Systems and Equipment*, Issue 3.

It is essential that the supervised premises transceivers listed in this section are used in accordance with the appropriate installation instructions and the guidance provided in Annex C of LPS 1277 Issue 3 *Requirements for LPCB Approval and listing of Alarm Transmission Systems and Equipment*.

Specifiers are advised to check the issue of LPS 1277 against which the supervised premises transceiver is approved. The current publication of LPS 1277 is Issue 4.

PART 4: SECTION 2

SAFES, STRONGROOMS AND SECURE SAFE CABINETS

This section lists safes, strongrooms and secure safe cabinets that have been designed for the secure storage of cash and valuables, but which may also be used to secure other high risk assets, including secure information.

The safes, strongrooms and security cabinets listed are graded according to their resistance to manual intervention attack tests. These are undertaken by experienced laboratory test engineers using tools carefully selected to achieve access to the contents of the safe using the minimum time and resistance units possible.

Domestic safes and those typically fitted in hotel bedrooms should generally be graded in accordance with EN 14450 *Secure storage units - Requirements, classification and methods of test for resistance to burglary - Secure safe cabinets*.

Commercial safes and strongrooms are either graded in accordance with LPS 1183 Requirements and testing procedures for the LPCB approval and listing of *safe storage units - Part 1: Safes and strongrooms* or EN 1143-1 *Secure storage units - Requirements, classification and methods of test for resistance to burglary - Part1: Safes, strongroom doors and strongrooms*.

Deposit safes are graded in accordance with EN 1143-2 *Secure storage units - Requirements, classification and methods of test for resistance to burglary - Part 2: Deposit systems*.

Specifiers should also consider ensuring safes used for cash recycling (either automated or manual) are approved to:

- EN 1143-1 to ensure any automated cash issuing devices do not undermine the safes resistance to forced entry attacks.
- EN 1143-2 to ensure the safe itself and depository systems resist forced entry and fishing/trapping attacks respectively.

Cash and Jewellery Ratings

Table 1 indicates typical cash and jewellery ratings attributed to safes and strongrooms according to their approved resistance grade. These ratings should only be used as a guide since each insurer defines their own ratings depending on the performance of the safes and the situation in which the safes and strongrooms are to be used. Specifiers are strongly advised to discuss the issue of cash and jewellery ratings with their insurer prior to selecting a safe or strongroom.

Table 1: Typical Cash and Jewellery Ratings for Safes and Strongrooms

Standard	Resistance grade	Typical overnight cash rating (£k)	Typical overnight jewellery rating (£k)
EN 14450	S1	2	20
	S2	4	40
LPS 1183 and EN 1143-1	0	6	60
	I	10	100
	II	17.5	175
	III	35	350
	IV	60	600
	V	100	1000
	VI	150	1500
	VII to XIII	-	-

Compatible Locks

The locks that have been approved for use on each of the approved safes and strongrooms are listed in the 'compatible locks' section of each manufacturer's entry in the Red Book. Specifiers and end users are advised that the performance of the safes to the relevant standards is dependent on them being fitted with the locks listed.

Installation and maintenance

It is important to ensure that safes are installed in accordance with the manufacturer's instructions and that all exposed fixings, the substrate into which the device is fitted and the locking mechanisms are regularly checked to ensure that they are in good condition and that they have not been tampered with.

PART 4: SECTION 2.1

SAFES

The safes listed in this section are approved by LPCB to one or more of the following standards:

- EN 1143-1 *Secure storage units. Requirements, classification and methods of test for resistance to burglary. Safes, strongroom doors and strongrooms.*
- LPS 1183 *Requirements and testing procedures for the LPCB approval and listing of safe storage units. Part 1: Safes and strongrooms*

Copies of LPS 1183 can be downloaded free of charge from www.redbooklive.com

Explosion (EX) Designation

This optional designation is only applicable to safes achieving grades II and above. This designation indicates a product offers resistance to detonation of a PETN (Pentaerythritol tetranitrate) explosive charge followed by post detonation tool attacks aimed at achieving entry to the safe. Where the use of explosive charges is perceived to be a threat it is recommended products with this designation are selected.

Core Drill (CD) Designation

This optional designation is only applicable to safes achieving grades IV and above to EN 1143-1. This designation reflects the ability of a product to pass the diamond drill test specified within EN 1143-1, which is designed to demonstrate the product's superior resistance to methods of forced entry that solely involve the use of diamond core drills.

Safes that incorporate a deposit facility are covered by EN 1143-2 *Secure Storage Units - Requirements, classification and methods of test for resistance to burglary - Part 2: Deposit systems*. This describes tests over and above those specified in EN 1143-1 *Secure Storage Units - Requirements, classification and methods of test for resistance to burglary - Part 1: Safes, ATM safes, strongroom doors and strongrooms*, and includes 'forcing', 'fishing', 'trapping' and 'deposit retrieval'.

Deposit safes take a number of forms and these affect the classification attributed to them.

Deposit safes are normally located within a building and are primarily designed to enable employees to deposit money or other items without having to open the main door of the safe. Deposit safes receive a classification of "D-#" where # is the grade of resistance achieved during testing.

Deposit safes range from standard deposit safes with manual operation through to the distributed deposit systems employed by supermarkets.

Night safes, on the other hand, are often accessible from the street and are primarily used by financial institutions for providing a secure depositing system for their customers. Night safes receive a classification of "N-#" where # is the grade of resistance achieved during testing.

PART 4: SECTION 2.4

STRONGROOMS

Strongrooms listed in this section are approved by LPCB to one or more of the following standards:

- EN 1143-1 *Secure storage units - Requirements, classification and methods of test for resistance to burglary - Part 1: Safes, ATM safes, strongroom doors and strongrooms.*
- LPS 1183 *Requirements and testing procedures for the LPCB approval and listing of safe storage units - Part 1: Safes and strongrooms.*

Copies of LPS 1183 can be downloaded free of charge from our website www.redbooklive.com.

Strongrooms take two forms:

- Cast in-situ. The strongroom structure is cast on site where there is insufficient access to manoeuvre prefabricated panels into place.
- Pre-fabricated. The strongroom is formed on site from pre-fabricated panels, designed to bolt together securely to form the desired configuration.

Strongrooms are not only designed to secure larger volumes of cash and jewellery but are increasingly used to store items such as artwork and antiquities, pharmaceuticals, military equipment and highly sensitive documentation. Strongrooms are also increasingly being used to protect large scale IT server hubs due to the high value of the server equipment and business continuity risks associated with the potential loss of such equipment or data.

It is important to ensure that all exposed fixings, jointing plates, the substrate into which the device is fitted and the locking mechanisms are regularly checked to ensure that they are in good condition and that they have not been tampered with.

It is also important to ensure only those design options listed, such as special cable access or ventilation panels, are incorporated within the strongroom construction as the use of alternative options may undermine the level of security provided by the strongroom.

Explosion (EX) Designation

This optional designation is only applicable to strongrooms achieving grades II and above.

This optional designation indicates a product offers resistance to detonation of a PETN (Pentaerythritol tetranitrate) explosive charge followed by post detonation tool attacks aimed at achieving entry to the strongroom. Where the use of explosive charges is perceived to be a threat it is recommended products with this designation are selected.

Core Drill (CD) Designation

This optional designation is only applicable to strongrooms and strongroom doors achieving grades VIII and above to EN 1143-1. This designation reflects the ability of a product to pass the diamond drill test specified within EN 1143-1 which is designed to demonstrate the product's superior resistance to methods of forced entry that solely involve the use of diamond core drills.

Security enclosures that have been assessed to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers* are listed in this section.

Each security rating is appropriate to the level of risk to forced entry or removal, and covers everything from the secure storage of tools in the domestic environment, to protection of remote equipment on railway and telecommunications infrastructures. Some examples of applications include: secure site tool and plant storage units, portable office buildings and shipping containers.

The use of appropriately rated and installed physical security enclosures will protect the contents of the enclosure from the unwanted attentions of the opportunist or professional intruder.

LPS 1175 is based on manual attack testing. It currently defines eight levels of resistance (security ratings) to forced entry into the enclosure and removal of the enclosure from the supporting substrate. The security ratings are determined in terms of attack tools and time available to the intruder. They enable specifiers to select products according to the levels of threat faced.

Unless otherwise stated, an enclosure's resistance to forced entry is rated according to its ability to resist the creation of an aperture through which it is possible to pass a 400 mm by 225 mm elliptical test block. This is considered to be a size through which most intruders could pass. In some cases alternative failure criteria are used as the basis for the security rating attributed to the enclosure. Where used, the alternative failure criterion is designed to suit the enclosure's intended application, and is noted in the relevant product entry.

Further information about the security rating system can be found in LPS 1175, copies of which can be downloaded for free from www.redbooklive.com.

It is important to ensure that enclosures are installed in accordance with the manufacturer's instructions. All exposed fixings, the substrate onto which the enclosure is fitted, and the locking mechanisms should also be regularly checked to ensure that they are in good condition and that they have not been tampered with.

It is recommended that cash and jewellery should preferably be stored in safe storage units or strongrooms approved by LPCB. These are listed in Section 2. Those looking to prevent unauthorised removal of computer equipment should consider using physical protection devices listed in Section 12.

Key safes listed in this section are approved to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers.*

Unless otherwise stated, the security rating attributed to each key safe relates to the key safes' resistance to the following methods of attack:

- Forced entry into the key safe to remove a key stored within it.
- Unauthorised removal of the key safe from the supporting substrate.

It is recommended that the security ratings of the key safes used to store keys are at least equivalent to those of the products (e.g. doorsets) the keys operate. This is particularly important if the key safes are located in unprotected areas, for example, on the outside of properties. This is to ensure the key safe does not compromise the resistance to forced entry provided by the products that the keys operate.

Supra P500	Wall mounted key safe with twelve button combination	002045	P/N10102761P1-01 Revision F	1	1062a/01
Supra Consumer 500	Wall mounted key safe with twelve button combination	002049	P/N10102770P1-01 Revision K	1	1062a/02
Supra P500 with alarm switch	Wall mounted key safe with twelve button combination incorporating an alarm switch	002046	P/N10102761P1-01 Revision F	1	1062a/03

A copy of the certificate, confirming the full scope of approval, may be viewed online by clicking on the product name in the associated entry on www.RedBookLive.com

With much attention being placed on the role of emerging technologies in the fight against crime and terrorism, it is often easy to become detracted from the basics. However, good physical security is the bedrock of effective security. Without the delay to intrusion provided by effective physical security, detection simply tells you the intruder has been and gone. It is therefore always important to ensure suitable physical security measures are in place and that those measures provide sufficient delay to enable the intruder to be detected and a suitable response mounted in order to apprehend the intruder.

The delay provided by physical security equipment is typically measured in terms of the tools and time required to achieve entry through the physical security equipment. These combine to indicate the effort required by an intruder in order to gain unauthorised access through the physical security barrier.

Using physical security equipment that achieves a higher rating, or using a layered approach to physical security, can greatly increase the effort an intruder needs to exert in order to gain entry. That effort extends beyond the physical effort required to overcome the physical security equipment. It also includes the effort required to plan and prepare for the attack. The greater the investment in the planning and preparation that a criminal believes is required to conduct a successful attack, the less likely they are to conduct that attack unless the return on that investment is sufficient.

As the security ratings increase, the size and weight of tools required to compromise the products also increases. Using larger, heavier tools increases an intruder's likelihood of being detected through natural surveillance. They can also slow down the intruder if they have to carry those tools onto the site being attacked. This also increases the risk to the intruder of being caught. The greater that risk, the less likely the criminal is to conduct the attack in the first instance.

So how do security managers and other specifiers confirm whether a physical security product will afford a suitable delay against the tools and techniques likely to be employed by a determined intruder?

LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers* confirms the resistance to forced entry provided by security products, systems and building materials.

While previous versions of the standard specified six levels of resistance (security ratings), the latest versions (Issue 6 and 7) specify eight security ratings. The levels of risk on which the security ratings in Issue 6 and 7 are based are represented in the following chart.

LPS 1175 supports the assessment, approval and specification of security doors, shutters and grilles together with many other products and systems designed to prevent unauthorised access by mechanical means. These include:

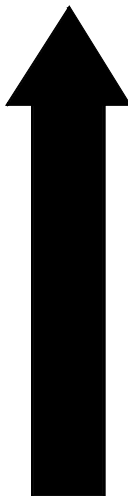

- Access covers
- Cladding systems
- Containers
- Curtain walling systems
- Fences
- Folding doorsets
- Garage doorsets
- Gates and turnstiles
- Hinged doorsets
- Partitioning systems
- Roofing systems
- Security enclosures
- Security grilles
- Security screens
- Sheds and tool stores
- Shutters
- Skylights
- Sliding doorsets
- Strongpoints
- Temporary buildings
- Vehicles
- Walls
- Windows

LPS 1175 is based on manual attack testing with the resistance provided by the products measured in terms of the attack tools and time available to the attacker. It enables specifiers to select products according to the risk.

Further information on the security rating system and attack tools can be found in the standard itself, which can be downloaded for free from www.redbooklive.com.

PART 4: SECTION 5

PHYSICAL SECURITY PROTECTION OF BUILDINGS AND OTHER FACILITIES

 <p>HIGH RISK</p> <p>LOW RISK</p>	LPS 1175 SR 8	Products certified to this standard provide 20 minutes of resistance to extreme means of attempting forced entry into higher value storage areas.
	LPS 1175 SR 7	Products certified to these standards provide 10 minutes of resistance to professional means of attempting forced entry into higher value storage areas using a wide range of tools including mains powered tools.
	LPS 1175 SR 6	
	LPS 1175 SR 5	Products certified to these standards resist experienced attempts at forced entry using a wide range of tools including battery powered tools lasting up to 10 minutes (SR4 and SR5) or 5 minutes (SR3).
	LPS 1175 SR 4	
	LPS 1175 SR 3	
	LPS 1175 SR 2	Products certified to this standard provide 3 minutes of resistance to determined attack by an opportunist burglar using a range of techniques including those that involve creation of noise.
	LPS 1175 SR 1	Products certified to this standard provide 1 minute of resistance to opportunist attempts at entry using a range of techniques including those that create noise such as those involving breaking glass.

In addition to certifying products to LPS 1175, LPCB also offers approval of products to the following standards:

- PAS 24: 2012 *Enhanced security performance requirements for doorsets and windows in the UK - External doorsets and windows intended to offer a level of security suitable for dwellings and other buildings exposed to comparable risk.*
- EN 1627: 2011 *Pedestrian doorsets, windows, curtain walling, grilles and shutters - Burglar resistance - Requirements and classification.*

PAS 24 is primarily aimed at domestic applications where intruders will generally use stealth to avoid detection. This version of the standard covers residential doors and windows.

The levels of resistance offered by products approved to PAS 24 is generally lower than that provided by products approved to LPS 1175, especially if the products incorporate glass or in situations where the criminal can make sustained amounts of noise while attempting entry. Nonetheless, Secured by Design (SBD) have reported a significant reduction in domestic burglary as a result of the use of products approved to PAS 24.

EN 1627 is the European standard aimed at façade security products used in domestic and commercial situations. Its lower levels, i.e. up to resistance class 3, are primarily aimed at situations where criminals are more likely to use stealth for fear of attracting attention when attempting to force entry into premises.

The scope of products that can be approved to LPS 1175, PAS 24 and EN 1627 are summarised in the following table:-

PART 4: SECTION 5

PHYSICAL SECURITY PROTECTION OF BUILDINGS AND OTHER FACILITIES

Physical security product	LPS 1175: Issue 7 ⁽ⁱ⁾	PAS 24: 2012	EN 1627: 2011
Access covers and hatches	✓		
Cladding systems	✓		
Curtain walling	✓		✓
Doorsets (Cantilevered)	✓		
Doorsets (Folding)	✓	✓ ⁽ⁱⁱ⁾	✓
Doorsets (Hinged)	✓	✓ ⁽ⁱⁱⁱ⁾	✓
Doorsets (Revolving)	✓		
Doorsets (Sliding)	✓	✓ ⁽ⁱⁱ⁾	✓
Gates and turnstiles	✓		
Partitioning systems	✓		
Rooflights and skylights	✓	(M)	(M)
Roofing systems	✓		
Secondary glazing systems	✓		✓
Security grilles	✓		✓
Security screens	✓		✓
Security shutters	✓		✓
Temporary buildings	✓		
Walls and ceilings	✓		
Windows	✓	✓ ^(iv)	✓

Notes:

- (i) LPS 1175: Issue 7 covers many other types of product extending beyond those listed above.
- (ii) Folding doorsets and sliding doorsets with any frame member longer than 3 m are not covered by PAS 24:2012.
- (iii) The following types of hinged doorset are not covered by PAS 24:2012:
 - Double swing hinged doorsets, i.e. those hinged doorsets with leaves that open in both directions.
 - Doorsets with leaves with two halves, e.g. stable doorsets.
 - Doorsets with any frame member longer than 3 m.
 - Doorsets that are not rectangular e.g. arched doorsets.
- (iv) PAS 24 2012 and EN 1627:2011 do not define how products designed to be used in the horizontal plane, such as rooflights, should be tested.
- (v) The following types of window are not covered by PAS 24:2012:
 - Windows incorporating top hung open-in casements, side swing casements, horizontally sliding sashes or louvered vents.
 - Windows with any frame member longer than 3 m.
 - Windows that are not rectangular, e.g. round or arched windows.

Specifiers should note that, although the working times specified for grades 2, 3 and 4 in EN 1627 match those defined for ratings 2, 3 and 4 in LPS 1175 (i.e. 3 minutes, 5 minutes and 10 minutes respectively), LPS 1175 covers risks associated with a far wider array of tools and attack methods, including those that involve noise. **Specifiers should not assume products approved to EN 1627 achieve the 'equivalent' ratings when tested to LPS 1175.**

The quality of the testing conducted to EN 1627 relies heavily on the knowledge and experience of the test engineers conducting that testing. Therefore, in order to ensure products approved by LPCB deliver the protection expected, LPCB only recognises tests conducted to EN 1627 by BRE Global's highly experienced team of test engineers or by other laboratories that have suitably demonstrated their competence to conduct tests to EN 1627 to an equally high standard.

Detailed comparisons of EN 1627 and LPS 1175 are available from the Security Team (email PhysicalSecurity@bre.co.uk)

Hotel Doorsets

PART 4: SECTION 5

PHYSICAL SECURITY PROTECTION OF BUILDINGS AND OTHER FACILITIES

In addition to these standards, LPCB has drafted a standard for Hotel Doorsets. LPS 1268 *Specification for the testing and classification of hotel bedroom doorsets* covers many aspects of the doorset's performance, from security performance through to fire resistance, acoustic and general durability. Copies of the standard are available free of charge and can be obtained by emailing PhysicalSecurity@bre.co.uk

Product Selection

When selecting a security door, shutter, grille or other façade element, it is important to note aspects such as the size, locking systems, modes and directions of opening, and the type, size and location of any glazing incorporated within the product or system. All can affect the level of security provided by the product. These aspects of each certified product have therefore been described to enable selection of the most appropriate product for the desired application. Where options, such as glazed in-fills within door leaves, are not covered in the listing, those options fall outside the scope of that product's approval.

Unless otherwise stated, the security ratings attributed to the products listed require all lock bolts to be fully engaged and any deadlocking mechanism provided must be engaged. If a product is shown to achieve more than one security rating:

- The lower rating indicates the security rating achieved by the product when in the 'minimum locked condition'. That locked condition occurs when the opening element (e.g. door leaf) is closed and only automatic latching mechanisms are engaged.
- The higher rating indicates the security rating achieved by the product when in the optimum locked condition. That locked condition occurs when all locking points are engaged and deadlocked.

Installation, Service and Maintenance

It is important to ensure products are installed and maintained in accordance with the manufacturer's instructions and that all exposed fixings, the substrate into which the device is fitted and the locking mechanisms are regularly checked to ensure that they are in good condition and that they have not been tampered with. For added peace of mind, we recommend products are:

- Installed by companies certified to LPS 1271 *Requirements for the LPCB Approval and Listing of companies installing fire and security doors, doorsets, shutters and active smoke/fire barriers.*
- Serviced and maintained by companies certified to LPS 1197 *Requirements for the LPCB Approval and Listing of companies inspecting, repairing and maintaining fire and security doors, doorsets, shutters and active smoke/fire barriers.*

It is also recommended to ensure their scope of approval to these standards covers the product to be installed, serviced or maintained.

A list of currently approved installation, service and maintenance companies is provided in Installers Service and Maintenance section of www.redbooklive.com.

Other Performance Attributes

LPCB also offer approvals of a range of other performance attributes alongside security. These include:

- Acoustics
- Durability
- Fire Resistance
- Impact Resistance
- Operating Forces
- Thermal Performance
- Weathertightness

PART 4: SECTION 5.1

SECURITY DOORSETS

Doorsets listed in this section are approved to either/or the following standards:

- LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers.*
- LPS 2081 *Requirements and testing procedures for the LPCB approval and listing of building components, strongpoints, security enclosures and free-standing barriers offering resistance to intruders attempting to use stealth to gain entry*
- PAS 24 *Enhanced security performance requirements for doorsets and windows in the UK - External doorsets and windows intended to offer a level of security suitable for dwellings and other buildings exposed to comparable risk*
- EN 1627 *Pedestrian doorsets, windows, curtain walling, grilles and shutters - Burglar resistance - Requirements and classification.*

PART 4: SECTION 5.2

SECURITY WINDOWS

The windows in this section are approved to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers.*

The products listed in this section are generally designed for use in commercial applications.

LPCB has also published a standard for glazing and security glazing films which employs the principles contained within LPS 1175. LPS 1270 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant security glazing units* covers the resistance to manual attack of the glazing material. It enables specifiers to select new or replacement glazing that affords levels of security equivalent to that of the frame or façade in which it is to be employed. Glazing approved to LPS 1270 is listed in section 5.11.

PART 4: SECTION 5.4

GARAGE DOORS

Theft of equipment from garages is fairly common due to the value of equipment often stored within them and the ease with which burglars can overcome many garage doors. Burglars also target garages that provide access to the inside of the house via internal pedestrian doors because the burglars can:

- Attack the internal doorset unobserved by people in surrounding properties; and/or
- Use tools stored within the garage to aid their entry into the house.

Specifying garage doors that provide proven levels of resistance to forced entry therefore plays an important part in reducing:

- Theft of equipment from garages.
- Theft of items from houses resulting from entry through adjoining garages.

Garage doors listed in this section meet the requirements of either:

- LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers, or*
- EN 1627 *Pedestrian doorsets, windows, curtain walling, grilles and shutters - Burglar resistance - Requirements and classification.*

In addition to fitting approved garage doors, specifiers keen to improve the security of their garages should also consider using security enclosures approved to LPS 1175 and fitting intruder detection equipment approved by LPCB and installed by a competent installer. Please refer to section 3 for a list of approved security enclosures and section 1 for a list of approved intruder detection equipment.

PART 4: SECTION 5.6

SECURITY SHUTTERS

Security shutters listed in this section which provide resistance to manual forced entry are approved to either:

- LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers, or*
- EN 1627 *Pedestrian doorsets, windows, curtain walling, grilles and shutters - Burglar resistance - Requirements and classification.*

Security shutters listed in this section which provide ballistic resistance are approved to:

- BS EN 1522 *Windows, doors, shutters and blinds - Bullet resistance - Requirements and classification*

LPCB also issues approvals covering other aspects of shutter performance including fire resistance.

PART 4: SECTION 5.8

LOUVRE VENTS

Louvre vents listed within this section are approved to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, stongpoints, security enclosures and free-standing barriers*.

Unless otherwise stated, the approvals relate to the louvre vent's resistance to the creation of a hole large enough for a person to pass through, as indicated by the 225 mm by 400 mm elliptical test block defined in LPS 1175.

It is recommended specifiers select louvres rated to resist the creation of smaller holes if the louvres are to be used within the close proximity of equipment that needs to be protected from tampering/removal, or lock operating hardware that does not require a key (e.g. thumbturns, lever handles, push pads or panic bars).

For guidance, the test blocks used are:

Type	Test Block	Notes
Local penetration	8 mm (+3 mm/-0 mm) by 25 mm (+3 mm/-0 mm) rectangular section	Represents the louvre panel's likely resistance to creation of a hole through which a piece of wire, screwdriver, lever or other such device can be passed. Such an attack may be attempted by an intruder wishing to operate a panic bar, emergency lever handle or other non-deadlocked device capable of releasing the boltwork on the item in which the louvre panel is mounted or on an item directly adjacent to that in which the louvre panel is mounted.
Hand hole	60 mm (+3 mm/-0 mm) diameter	Represents the louvre panel's likely resistance to creation of a hand hole. Such an attack may be attempted by an intruder wishing to: <ul style="list-style-type: none">• Operate a thumbturn to release the boltwork on the item in which the louvre panel is mounted or on an item directly adjacent to that in which the louvre panel is mounted.• Retrieve an item from the protected side of the louvre panel e.g. an item on display behind a shop window, a set of door keys or a set of car keys.
Complete access	Elliptical section of 400 mm (+3 mm/-0 mm) major axis by 225 mm (+3 mm/-0 mm) minor axis	Represents the louvre panel's resistance to creation of a hole through which an elliptical test block measuring 400 mm by 225 mm may be passed. This replicates the size a person may be able to pass through and reflects the test block defined in LPS 1175: Issue 7.

PART 4: SECTION 5.9

SECURE WALLING SYSTEMS

Walling systems listed in this section are approved to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers.*

In order to comply with the terms of the approval, the walling systems must be designed and installed in accordance with the relevant system manuals noted within the product entry.

Unless otherwise stated, the approvals cover:

- Plain systems. That is, the approval excludes service penetrations, ducts or other openings such as doors and windows.
- Resistance to the creation of an access hole, within the area of the barrier, through which it is possible to pass a 225 mm by 400 mm elliptical test block defined in LPS 1175.

It is recommended that evidence is sought to confirm the compatibility of any doors, windows, etc. to ensure the combined assembly offers the required security rating. Where such compatibility has been proven, this is indicated in the relevant listing.

This section includes security glazing that has been approved to one or more of the following standards:

- LPS 1270: Issue 1 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant security glazing units*
- EN 356: 2000 *Glass in Building - Security Glazing. Testing and classification of resistance against manual attack*
- EN 1063: 2000 *Glass in building. Security Glazing. Testing and classification of resistance against bullet attack.*

LPS 1270 was developed because it was considered the method for classifying the attack resistance of security glazing specified within the current European standard (EN 356: 2000) was incompatible with that employed within LPS 1175: Issue 7 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers*. This was because:

- EN 356: 2000 does not classify glass according to its resistance to different levels of attack based on the tools and time available to an intruder.
- The tests contained within EN 356: 2000 do not evaluate the glass's susceptibility to attacks involving the creation of small holes through which locking hardware may be manipulated and/or protected items, such as items on display within shop windows or display cases, may be removed.

The LPS 1270 classification system contains three digits. Each digit describes the glazing's resistance to creation of a different size of hole, as described in the table below.

Digit	Type	Test Block	Notes
1 st	Local penetration	8 mm (+3 mm/-0 mm) by 25 mm (+3 mm/-0 mm) rectangular section	Represents the glazing's likely resistance to creation of a hole through which a piece of wire, screwdriver, lever or other such device can be passed. Such an attack may be attempted by an intruder wishing to operate a panic bar, emergency lever handle or other non-deadlocked device capable of releasing the boltwork on the item in which the glazing is mounted or on an item directly adjacent to that in which the glazing is mounted.
2 nd	Hand hole	60 mm (+3 mm/-0 mm) diameter	Represents the glazing's likely resistance to creation of a hand hole. Such an attack may be attempted by an intruder wishing to: <ul style="list-style-type: none"> • Operate a thumbturn to release the boltwork on the item in which the glazing is mounted or on an item directly adjacent to that in which the glazing is mounted. • Retrieve an item from the protected side of the glass e.g. an item on display behind a shop window, a set of door keys or a set of car keys.
3 rd	Complete access	Elliptical section of 400 mm (+3 mm/-0 mm) major axis by 225 mm (+3 mm/-0 mm) minor axis	This reflects the size of aperture specified in LPS 1175: Issue 7. The digit confirms the glazing's resistance to creation of a hole through which an elliptical test block measuring 400 mm by 225 mm may be passed. This replicates the size a person may be able to pass through and reflects the test block defined in LPS 1175: Issue 7.

Many important facilities, especially those of utility companies, are unmanned and remote from the main business. At the request of the utility companies, access covers protecting items such as valves, switchgear and meters are now security rated to provide protection against malicious attack.

LPCB approves access covers to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers*. The approval procedures and conditions that apply to access covers are the same as those that apply to security doors and shutters.

It is important that specifiers only select access covers that are covered by the scope detailed on the certificate since products that fall outside that scope may not provide an equivalent level of security.

It is also important to ensure that the products are installed in accordance with the manufacturer's instructions and that all exposed fixings, the substrate into which the device is fitted and the locking mechanisms are regularly checked to ensure that they are in good condition and that they have not been tampered with.

PART 4: SECTION 7
PERIMETER SECURITY PRODUCTS

This section lists perimeter security products such as fences, gates and turnstiles that have been approved to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers*.

While previous versions of the standard specified six levels of resistance (security ratings), the latest version (Issue 6 and 7) specifies eight security ratings. The levels of risk on which the security ratings are based in Issue 6 and 7 are represented in the following chart.

 <p>HIGH RISK</p> <p>LOW RISK</p>	LPS 1175 SR 8	Products certified to this standard provide 20 minutes of resistance to extreme means of attempting forced entry into higher value storage areas.
	LPS 1175 SR 7	Products certified to these standards provide 10 minutes of resistance to professional means of attempting forced entry into higher value storage areas using a wide range of tools including mains powered tools.
	LPS 1175 SR 6	
	LPS 1175 SR 5	Products certified to these standards resist experienced attempts at forced entry using a wide range of tools including battery powered tools lasting up to 10 minutes (SR4 and SR 5) or 5 minutes (SR 3).
	LPS 1175 SR 4	
	LPS 1175 SR 3	
	LPS 1175 SR 2	Products certified to this standard provide 3 minutes of resistance to determined attack by an opportunist burglar using a range of techniques including those that involve creation of noise.
	LPS 1175 SR 1	Products certified to this standard provide 1 minute of resistance to opportunist attempts at entry using a range of techniques including those that create noise such as those involving breaking glass.

PART 4: SECTION 8

VEHICLE SECURITY BARRIERS

Vehicle security barriers and their associated foundations are evaluated against the requirements of PAS 68: 2013 *Impact test specifications for vehicle security barrier systems*.

Barriers are classified according to the following measurements after a single impact by a vehicle of a defined mass, velocity and angle of impact:

- The distance the vehicle passed beyond the plane of the barrier.
- The distance the major debris dispersed beyond the plane of the barrier.

While many products placed on the market claim to deliver performance commensurate with that required in PAS 68, few claims are supported by independent approvals such as that provided by LPCB. This leaves specifiers vulnerable to changes to the products specification which may not be evident when presented with a copy of a type test report.

The products' performance is a factor of its design, quality of manufacture and how it is installed, maintained and used. LPCB's approval scheme therefore targets these factors. In doing so, LPCB certification and Red Book listing provides specifiers and users independent assurance that the impact classification allocated to vehicle security barriers reflect their performance when installed and maintained in accordance with the product instructions.

LPCB also offers optional approval confirming a vehicle barrier's resistance to manual attacks aimed at undermining the barrier's ability to prevent a vehicle passing it unhindered in accordance with LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers*.

The scope of LPCB approvals is due to be extended to cover vehicle barriers to the following international standards:

- CEN Workshop Agreement CWA 16221: 2010 *Vehicle security barriers. Performance requirements, test methods and guidance on application*.
- ISO International Workshop Agreement IWA 14-1: 2014 *Vehicle security barriers. Part 1: Performance requirements, vehicle impact test method and performance rating*.

This section will include vehicle security barriers such as:

- Fixed bollards
- Rising bollards
- Road blockers
- Drop arm barriers

In addition to ensuring the barrier resists vehicle impact, it is important to ensure control equipment used to operate raising bollards, blockers and other powered barriers is suitably resistant to being tampered with to prevent the barrier being operated. Specifiers should therefore consider specifying such equipment is housed within suitably secure enclosures related to LPS 1175. Secure enclosures rated to LPS 1175 are listed in Section 3.

This section lists cycle racks and stands that have been approved to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers*.

The approval confirms the resistance to unauthorised removal of cycles from the products listed when those products are installed and maintained in accordance with the approved instructions, and cycles are secured to them in accordance with the instructions provided with the product.

If a product incorporates a locking mechanism, that mechanism's resistance to attack is covered by the security rating attributed to the product. In such cases, details of the locking mechanism(s) covered by the approval are included within the product listing. However, if the product relies on the user's cycle lock to secure the cycle to it, the performance of the user's lock is not covered by the scope of the approval and it is the user's responsibility to ensure the cycle lock they use offers appropriate resistance to attack.

The approval does not cover the products' ability to prevent:

- Removal of any individual components from the cycles.
- Vandalism to the cycles.

In addition to approving the cycle racks and stands listed in this section, LPCB also approve:

- Security enclosures designed to secure cycles to LPS 1175. Those products are listed in Section 3 (Secure enclosures).
- Padlocks to LPS 1654 *Requirements and testing procedures for the LPCB approval and listing of padlocks*. Those products are listed in Section 16 (Padlocks and padlock fittings).

PART 4: SECTION 10

GAS CYLINDER SECURITY DEVICES

This section lists gas cylinder security devices that have been approved to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers.*

The approval covers the resistance to unauthorised removal of gas cylinders provided by the security devices when installed and maintained in accordance with the approved instructions.

While previous versions of the standard specified six levels of resistance (security ratings), the latest versions (Issues 6 and 7) specifies eight security ratings. These range from opportunist (1 minute attacks using easily concealable hand tools) up to extreme methods of attacks (20 minute attacks using a wide range of hand tools, power tools and thermal cutting equipment).

Further details of the grading system can be found in LPS 1175, copies of which can be downloaded free of charge from www.redbooklive.com.

The approval does not cover the resistance to unauthorised operation of the gas cylinders when secured by the devices listed.

Product Selection

When selecting a gas cylinder security device, check that the product's approval covers the types and sizes of cylinders to be secured, the compatible locking systems listed and the substrates to which the devices may be fixed in order to provide secure anchorage - all can affect the level of security provided by the product.

To enable selection of the most appropriate product for the desired application, the listing defines the gas cylinders that are covered by the scope of approval in terms of the supplier, supplier reference and following dimensions:

Key:

h_a = Height of cylinder, including foot ring and neck ring and/or valve cap

h_b = Height of cylinder to base of neck ring

h_c = Height of cylinder to edge of shoulder

h_d = Height of foot ring

d_a = Diameter at base of neck ring/valve cap

d_b = Diameter of cylinder

To achieve the security ratings:

- the gas cylinder security devices must be installed in accordance with the manufacturer's instructions;
- all locks must be fully engaged and deadlocked; and

- (c) all exposed fixings, the substrate onto which each device is fitted and the locking mechanism(s) must be regularly checked to ensure they are in good condition and that they have not been tampered with.

PART 4: SECTION 11

PHYSICAL SECURITY DEVICES FOR COMPUTERS AND OTHER ICT EQUIPMENT

At the request of the Association of British Insurers, the LPCB developed LPS 1214 *Specification for testing and classifying physical protection devices for personal computers and similar equipment* for the performance of security equipment designed to prevent removal of computer and other office equipment:

The standard currently defines two categories of protection. Both categories of protection device prevent theft of the complete computer for three minutes allowing a response by Police or security guards, while Category II products also prevent removal of the computer chips for the same period.

Suitable applications for products certified to LPS 1214 are described below:

Category I: Prevent unauthorised removal of personal computers (PCs), file servers, printers, facsimile machines and other high value equipment for example where access is important for use and the component value is low.

Category II: Prevent unauthorised removal of or access to personal computers (PCs), file servers, printers, facsimile machines and other high value equipment for example where the PC is both important and highly valued and/or the component value is high.

Specifiers requiring category II protection devices should ensure that they select a device suitable for their particular equipment and that there is suitable ventilation of the computer in accordance with any instructions and warranty conditions supplied with the computer.

In order that they will provide the required protection, the approved equipment must be installed in accordance with the manufacturer's instructions and be in the locked condition with keys removed and held in a secure location.

It is recommended that users regularly check that all exposed fixings and locking mechanisms are in good condition and that they have not been tampered with.

In addition to approving physical protection devices for personal computers and similar equipment to LPS 1214, LPCB also evaluate and approve the following equipment designed to secure larger volumes of ICT equipment to LPS 1175 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers*:

- Racking systems
- Modular enclosures
- Composite panelling systems designed for constructing data halls.

Security products approved to LPS 1175 Security Rating 2 provide an equivalent resistance to forced entry as that provided by an LPS 1214 Category I device.

It is also recommended that ICT equipment is marked with an asset management marking system approved to LPS 1225 *Requirements for the LPCB approval and listing of asset marking systems* and registered on a secure asset database certified to LPS 1224 *Requirements for companies providing secure asset registration services*. Marking devices and secured database services are listed in Sections 13 and 14.

PART 4: SECTION 12

ANTI-BANDIT ATM SECURITY DEVICES

A number of ATMs have been attacked while being replenished because this is when the cash cassettes are generally the most vulnerable to removal from the ATM.

Products listed in this section are designed to prevent the unauthorised removal of cash cassettes from the ATM safe when the ATM safe door is open.

The products have been approved to *LPS 1175 Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free standing barriers*.

LPS 1175 is based on manual attack testing and currently defines eight levels of resistance to entry.

These are measured in terms of attack tools and time available to the attacker. This enables specifiers to select products according to the risks that they and their property face.

Due to the intended application of these products, the entry criteria used to assess these products in accordance with clause 4.3 of LPS 1175 is defined in the notes relating to each of the products listed.

Although the evaluation and approval covers attempts to remove the products from the ATM safes to which they are fitted, they do not cover the attack resistance of those ATM safes.

The essential requirements of LPS 1224: Issue 2 *Requirements for Secure Database Registers* were developed as a result of needs identified by the Police, Insurers and Home Office. LPS 1224 ensured that Police and other legitimate enquirers can confirm ownership of property 24 hours a day while ensuring full details of property ownership are held securely and in accordance with the Data Protection Act.

Therefore, under the requirements of LPS 1224: Issue 2, the database operator must:

- (i) Have an established track record in the field of asset registration of at least one year.
- (ii) Operate the database in accordance with a documented set of procedures in accordance with the requirements defined in LPS 1224.
- (iii) Offer a telephone check line service manned by trained operatives. In accordance with Government policy, the service shall be available 24 hour a day and shall be free of direct charge to the enquirer, e.g. it shall not be chargeable to the enquirer as a premium rate telephone service.

More recently LPS 1224: Issue 3 *Requirements for companies providing security asset registration services* was developed. This covers database services provided over the internet as well as those which may be accessed using other media.

This section lists companies that run databases that have been assessed and approved to either version of LPS 1224.

The following marking devices listed have been tested to LPS 1225 *Requirements for the LPCB approval and listing of asset marking systems*.

LPS 1225 specifies requirements for the composition and performance of an asset marking system such that, when used according to the manufacturer's instructions, the asset marking device may:

- i) Enable the marked asset to be traced to the legal owner via a secure database register linked to the marking system employed.
- ii) Act as a theft deterrent in the first instance by virtue of known existence.

It is assumed that the part of the asset to which the asset marking device is applied is at least equal in resistance to removal from the asset as the asset marking device employed.

The two-part classification indicates the resistance of the product to eradication of ownership traceability and resistance to complete removal of marking without leaving evidence of previous existence. This gives the end-user the option of selecting a product to suit the required application. Complete removal of the marking and restoration of the asset gives maximum resale value to the stolen asset; however the standard does not take into account replication or replacement of components as part of asset restoration.

The overall classification designation achieved is given by two numerals separated by a plus sign. The first numeral represents the resistance rating to erasure of traceability and the second numeral to complete removal/asset restoration.

The two classifications are both on a scale of one to eight. Classification '1' performance relates to that which should be expected as a minimum for marking devices used in the retail trade and other public areas equipped with CCTV and security staff. Classification '8', on the other hand, is aimed at marking devices applied to assets that have a high value and this will be the subject of a more determined level of effort by the criminal in order to prevent traceability or completely remove the mark.

Long term durability of the system and associated components are beyond the scope of this standard, as are the performance requirements of any covert marking technology incorporated in the system.

Although this standard specifies that the product instructions shall include hazard data, confirmation of the authenticity of such data is not addressed.

All approved marking devices are marked with a unique asset identification code. The LPCB certification mark and reference numbers relating to the marking device and database, and the telephone number of the database will also be marked on the marking device, or where this is not viable, on separate warning labels which are supplied with the marking device.

In addition to LPS 1225, LPCB is currently working with manufacturers and specifiers to finalise standards classifying the performance of "microdot", "trace chemical" and RFID marking systems. Please contact the Security Team (email: PhysicalSecurity@bre.co.uk) for more information.

This section lists 'theft resistant' electronic products that have been assessed to LPS 1650 *Requirements and testing procedures for the LPCB approval and listing of 'theft resistant' electronic products*. This includes:

- In-car entertainment systems - PDA's
- DVD players and writers - Personal computers
- Health care equipment - Projectors and wipe boards
- Laptops - Printers
- Mobile telephones - Satellite navigation devices
- MP3 players - Televisions and screens

The attributes that make these products particularly desirable to thieves can be summarised into six elements and these elements are often referred to by the acronym CRAVED:

Concealable
Removable
Available
Valuable
Enjoyable
Disposable.

Whilst each element can be used to determine which products are likely to be stolen, the frequency at which the thefts occur may ultimately depend on just one attribute, the ease at which the item can be disposed.

The intention of LPS 1650 is to encourage the use of effective security features that make it difficult to return the product to a 'saleable' condition if stolen, thus reducing the level to which they are craved by criminals.

Whilst the standard does not specify any one particular design of anti-theft technology, it includes requirements for the performance of the following types:

- Denial of service technologies, such as PIN codes, removal coded panels and electronic keys
Use of effective denial of service technology can prevent the product being enjoyed by persons other than the legitimate owner(s).
- Asset marking systems (overt and covert) linked to secure databases providing traceability to the legal owner of the product
Asset marking that cannot be removed without damaging the product can make it harder for the thief to dispose of the item and reduce the value of the goods if removal is attempted.
- Anchoring devices providing mechanical resistance against unauthorised removal of the product.
Secure fixing to a solid mounting surface can increase the effort required to remove the product.
- Alarm /signalling technologies providing warning of attempted removal.
An audible alarm could make the product less concealable.

The requirements and tests of LPS 1650 permit the assessment and rating of the performance of the anti-theft security features built into or supplied with the product.

Where appropriate, reference is made to specific requirements of standards such as:

- LPS 1224 *Requirements for secure database registers.*
- LPS 1225 *Requirements for the LPCB approval and listing of asset marking systems.*
- LPS 1214 *Specification for testing and classifying physical protection devices for personal computers and similar equipment and a number of other applicable European standards.*

PART 4: SECTION 15

'THEFT RESISTANT' ELECTRONIC PRODUCTS

The overall security performance rating achieved by a product is indicated by a series of security performance classifications, expressed in the format shown below. To meet the minimum requirement of LPS 1650, a product must achieve at least one denial of service classification.

Format of security performance classification:

DSTX - OX - XX+X+X - FX - AX

Where:

DSTX = Denial of service classification

OX = Overt marking classification

XX+X+X = Covert marking classification

FX = Anchoring device classification

AX = Alarm classification

Notes:

1. 'X' are numerals corresponding to the security performance classification achieved for each of the anti-theft technologies. The larger the value of X, the higher the security rating.
2. Products meeting only some of the classification requirements will only display those ratings that apply.

For details of the security performance rating parameters and their classification refer to LPS 1650.

This section lists padlocks and padlock fittings that have been approved to one or more of the following standards:

- LPS 1654: Issue 1 *Requirements and testing procedures for the LPCB approval and listing of padlocks*
- EN 12320: 2012 *Building hardware - Padlocks and padlock fittings - Requirements and test methods*

LPS 1654 was developed because it was considered the method for classifying the attack resistance of padlocks specified within the current European standard (EN 12320) was incompatible with that employed within LPS 1175: Issue 7 *Requirements and testing procedures for the LPCB approval and listing of intruder resistant building components, strongpoints, security enclosures and free-standing barriers*. This was because:

- The manual attack tests defined in EN 12320 did not take into consideration the wide range of tools and attack techniques available to an attacker.
- The tools, attack techniques and available working time defined in EN 12320 did not correspond with the security rating classification system defined in LPS 1175.

The security ratings defined in LPS 1654 are loosely based upon domestic risks (security ratings 1 and 2), commercial risks (security ratings 2, 3 and 4), high security risks (security ratings 5 and 6) and extremely high security facilities (security ratings 7 and 8).

When selecting padlocks, it is important to consider whether the hasp and staple, padbar or other device to which the padlock is fitted offers comparable resistance to manual attack.

The following definitions are used in this section:

- Padlock with closed shackle - A padlock with 'shoulders' on the top of the body that partially protect the shackle.
- Padlock with open shackle - A padlock with no 'shoulders' on the body, as illustrated in the figure below.
- Shackle clearance - The distance between the top of the padlock body and the underside of the shackle, as illustrated in the figure below.
